

Ikusmatrix is an optional tool for **ProdysControlPlus** to help the user to manage in a simple way the establishment of connections from/to several different **Ikusnet** video codecs from a single window. It is specially useful when there are more encoders than decoders and a rapid switching of incoming video streams is desirable.

KeyFeatures

- ✓ Detection of all codecs on the network, even those behind NAT routers and 3G/4G networks.
- ✓ Establishment of video communications using "drag & drop".
- ✓ Single management screen including the previews of all the Ikusnet encoders detected. The video preview consist of a very low bitrate video transmission of 1 frame per second that is available at Ikusmatrix when the codec is detected, even if the communication has not been established yet.
- ✓ Establishment of a bidirectional talkback audio channel communication for coordination between studio and remote codecs with a single click.
